Some of us may agree that watching videos or even photos on a TV screen are more entertaining than viewing it on a laptop or PC. Here's where this media player with its USB host feature comes into the picture. The Amkette Flash TV allows users to play movies (DivX, XviD and VOB formats) directly from external USB storage devices and memory cards. That said, the device can also be used to view pictures and play music (MP3 and WMA formats).

The Amkette Flash TV boasts of a compact design along with the ability to play a wide range of media formats. The device has a fully functional remote control that makes browsing through the menu a breeze. The interface is

simple and has a total of five modes to choose from. The Movie, Music and Photo modes show previews of the files in the connected storage device while File mode lists all available documents and their information. Another nice touch is the copy and move feature that the device allows. When in File mode the user can choose the desired files that need to be copied to a different storage location and transfer them with a few button presses.

Video quality is decent and is as good as other media players in its category. To keep costs down the Amkette Flash TV misses out on HDMI output but includes a component out that allows you to play high definition videos at 720p.
