Amkette has launched unique cleaning solutions with Nanotechnology. Nanotechnology is science on a very tiny level. They are “self-cleaning” products that, when applied to typical LCD’s. Laptops simply make the dirt disappear. The nanofibers significantly increase the fabric’s surface area and porosity, giving it superior wiping characteristics and the ability to absorb oil and ultra-fine dust particles less than one micron in diameter. These cleaning kits are available in two shapes one for the small screens like laptops, computers monitors and other for bigger screens like LCD’s & Plasma’s. The multipurpose nature of the small easy to use kit, helps clean your electronic gadgets be it your laptops & desktops. The design of these kits makes them perfect to use while traveling.

The cleaning kit for the larger screens is boat shaped in design. This cleaning kit comes with an anti static brush with soft bristles to leave a scratch screen. The ‘Point Design’ helps to clean the hard to reach areas and keeps the screen shining from corner to corner.

The compact cleaner is intuitively designed with the cleaning solution bottle neatly fitting into the body of the cleaner. With the press of just one button the bottle is out for spraying and then as easily as it appears it goes back into the body. Giving the users, a one piece multi use gadget cleaning solution, which is easy to store and travel with.

Amkette also ensures that the solution being used is easily refillable while at the same time safe for LCD screens. Mr. Rajiv Bapna also added, “Amkette also shares the formula to make the cleaning solution at home for hassle free refilling of the cleaning solution bottle.”
